This can be difficult because of all the studs connecting at the same time. Make sure to apply a decent amount of pressure until this "roof" section is sitting flush.

Place the tiles onto the plate before attaching the plate itself. The tiles will fit snugly under the bracket and can't be added after.

This "landing gear" sits inside this hole without connecting with any studs. This hole is also used to connect the display / flight stand which we will make in a separate PDF.

These tiles are trapped by the rail piece above them. Slightly raise the rail piece or remove the underlying plates to make placing the tiles easier.

Another tricky connection. Try placing the round brick sideways on the table, and pushing the tail through the studs. This should give you a solid connection. It should look like this.

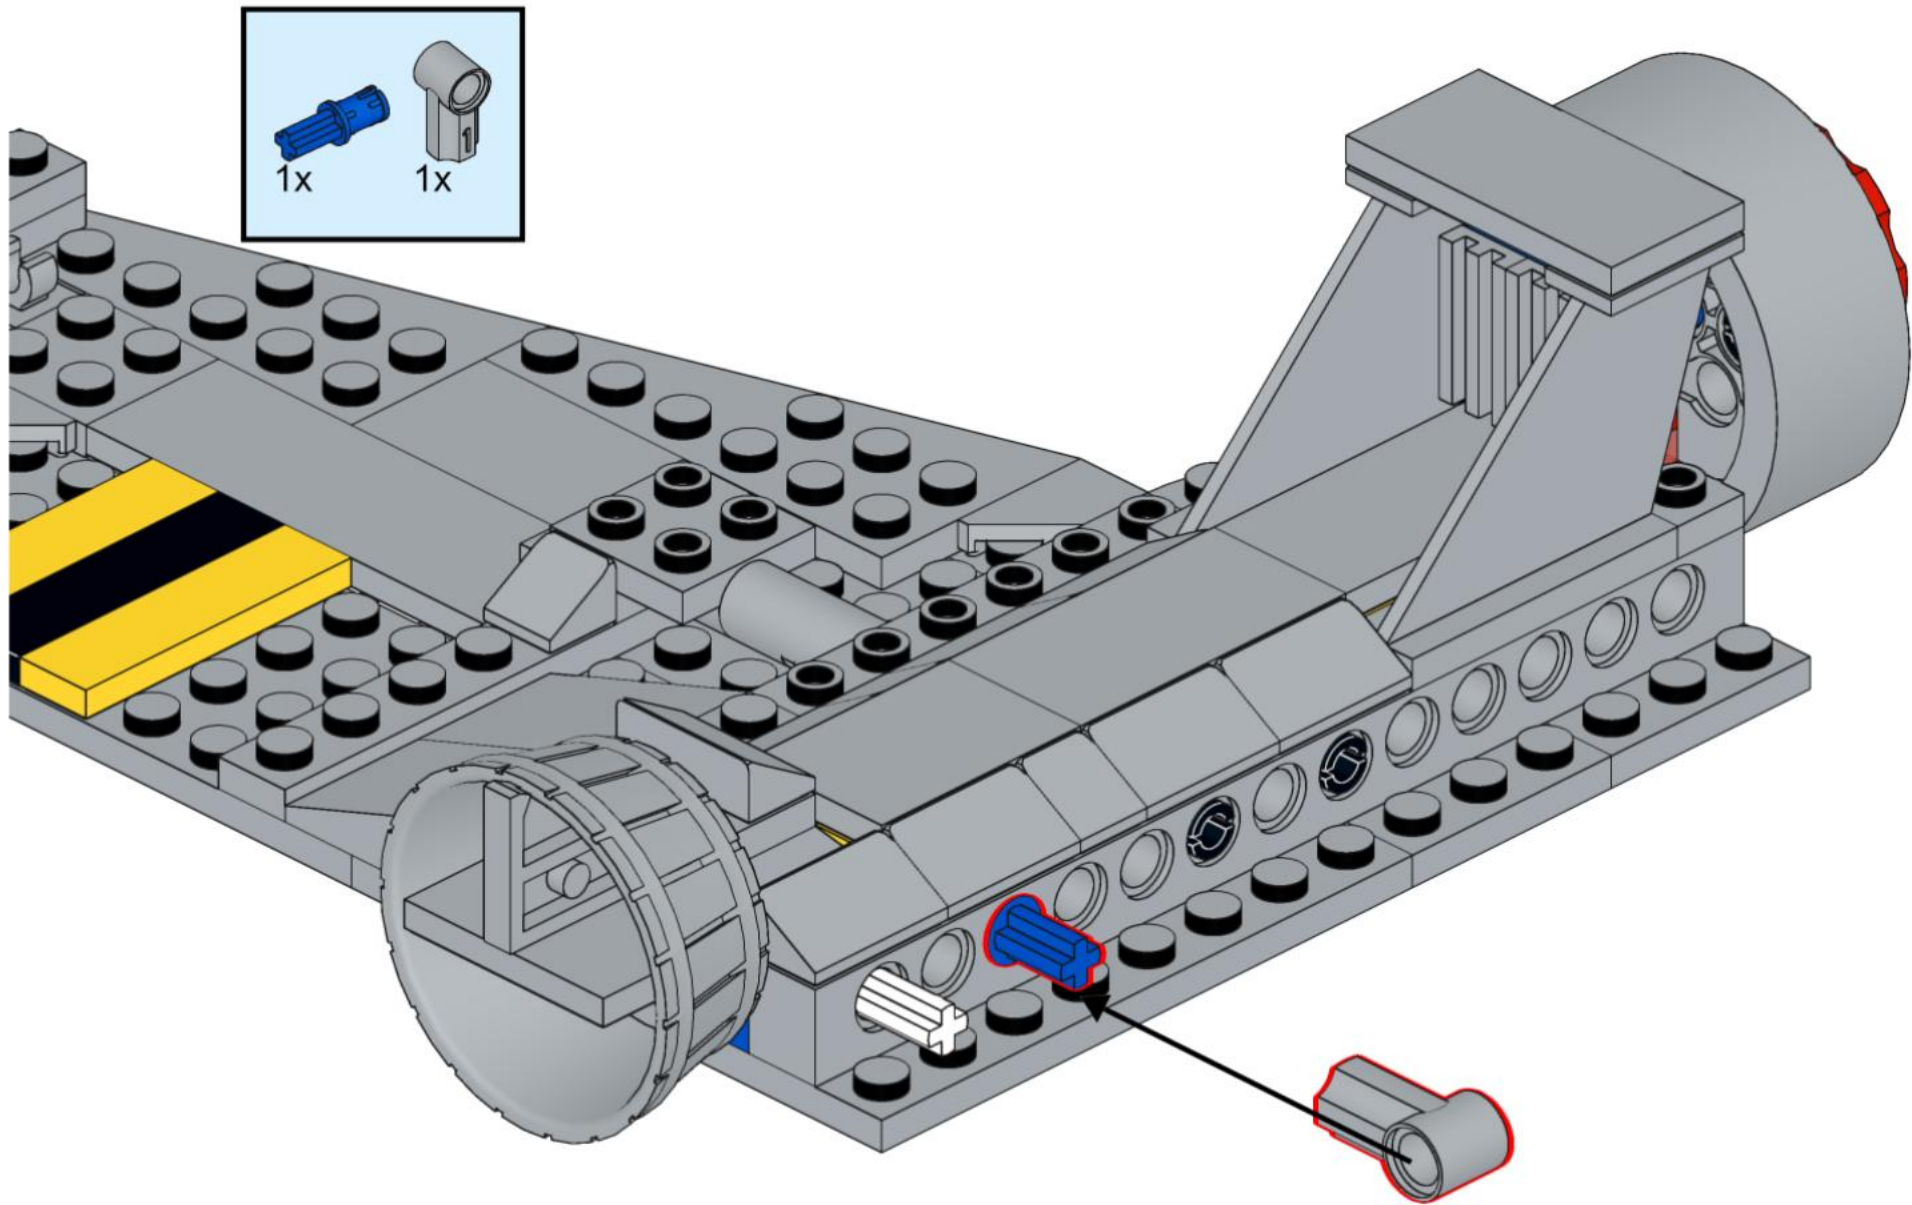

396

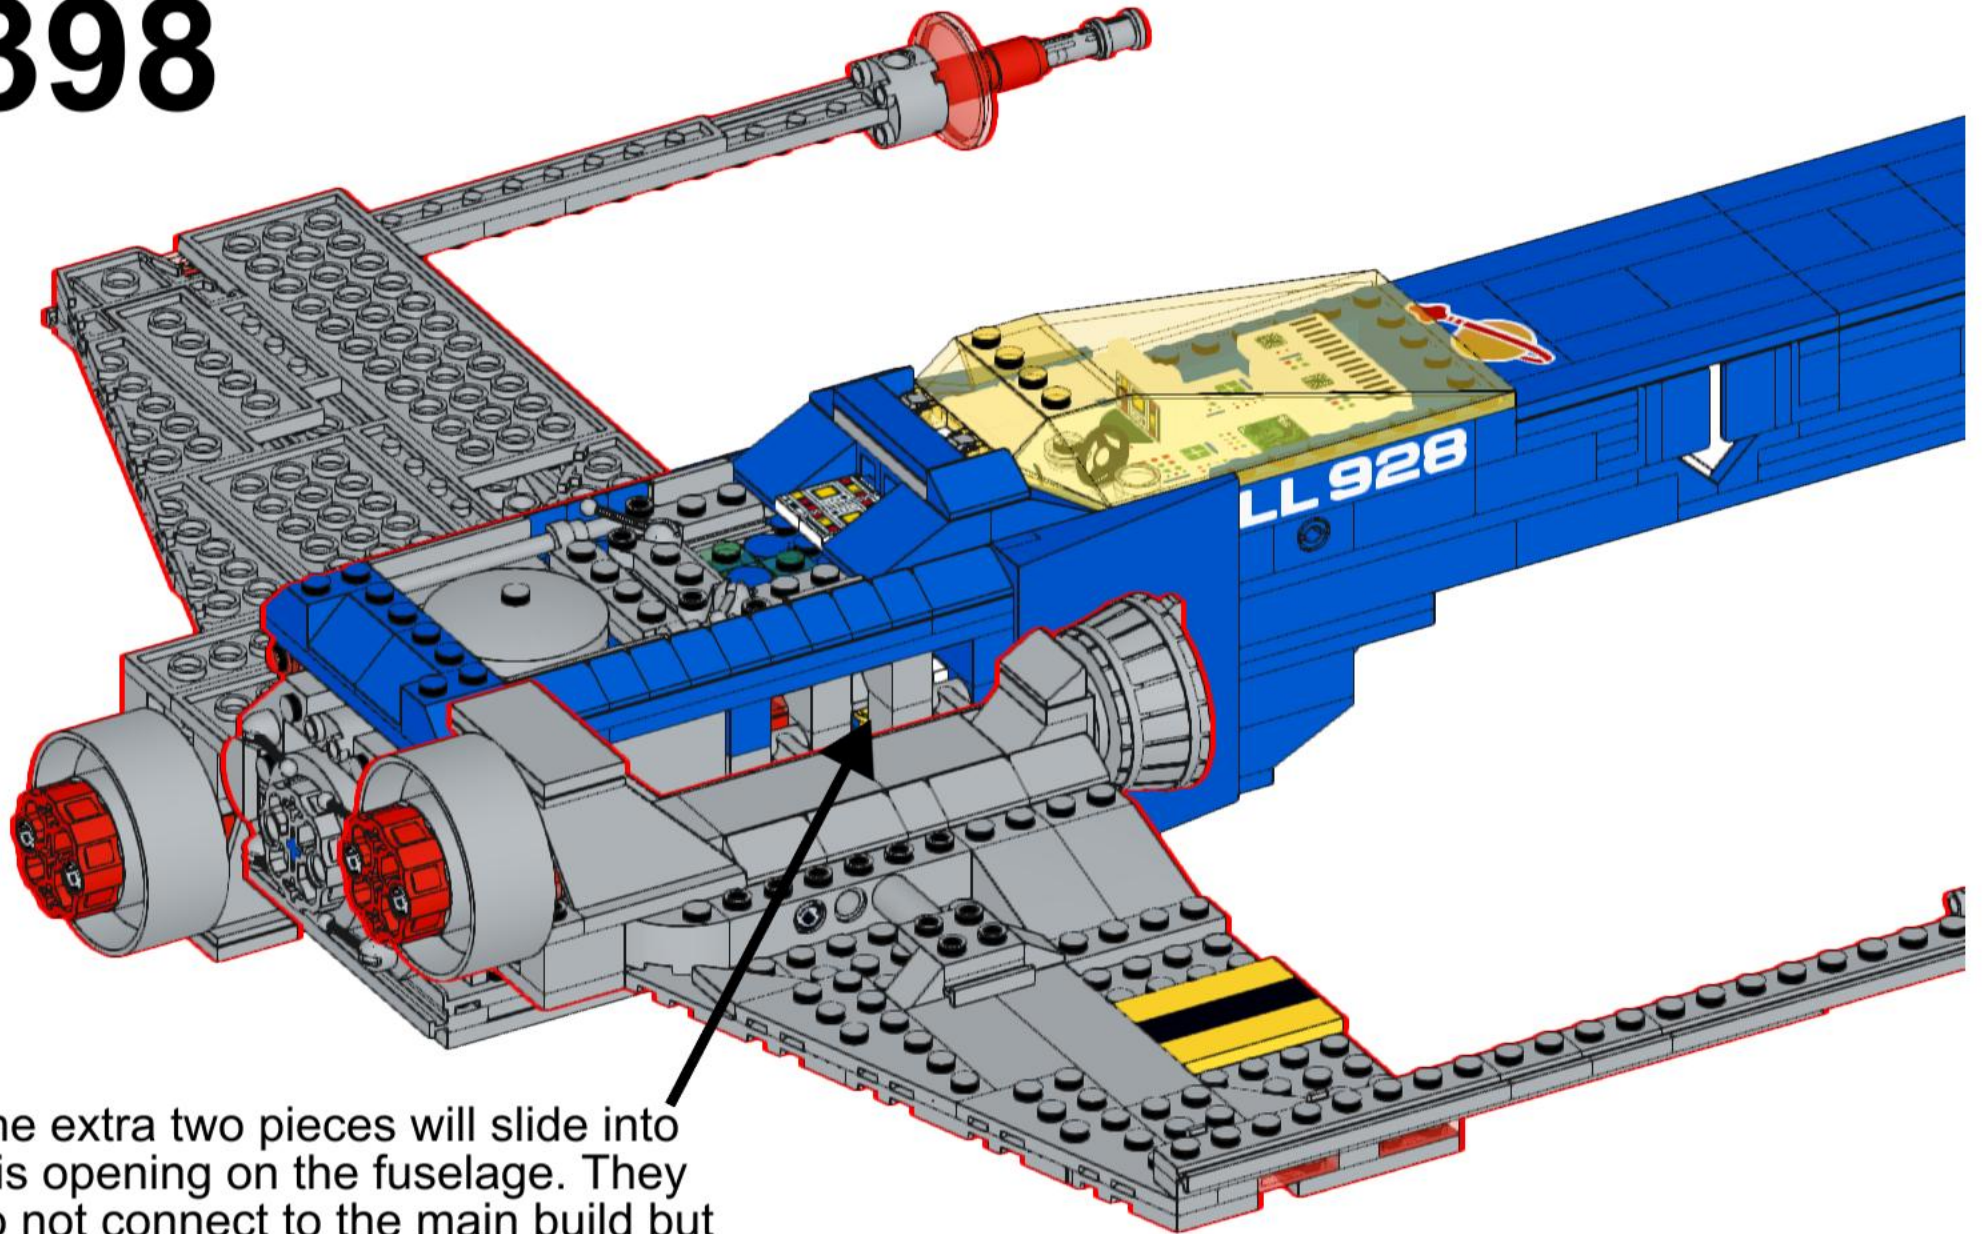

39

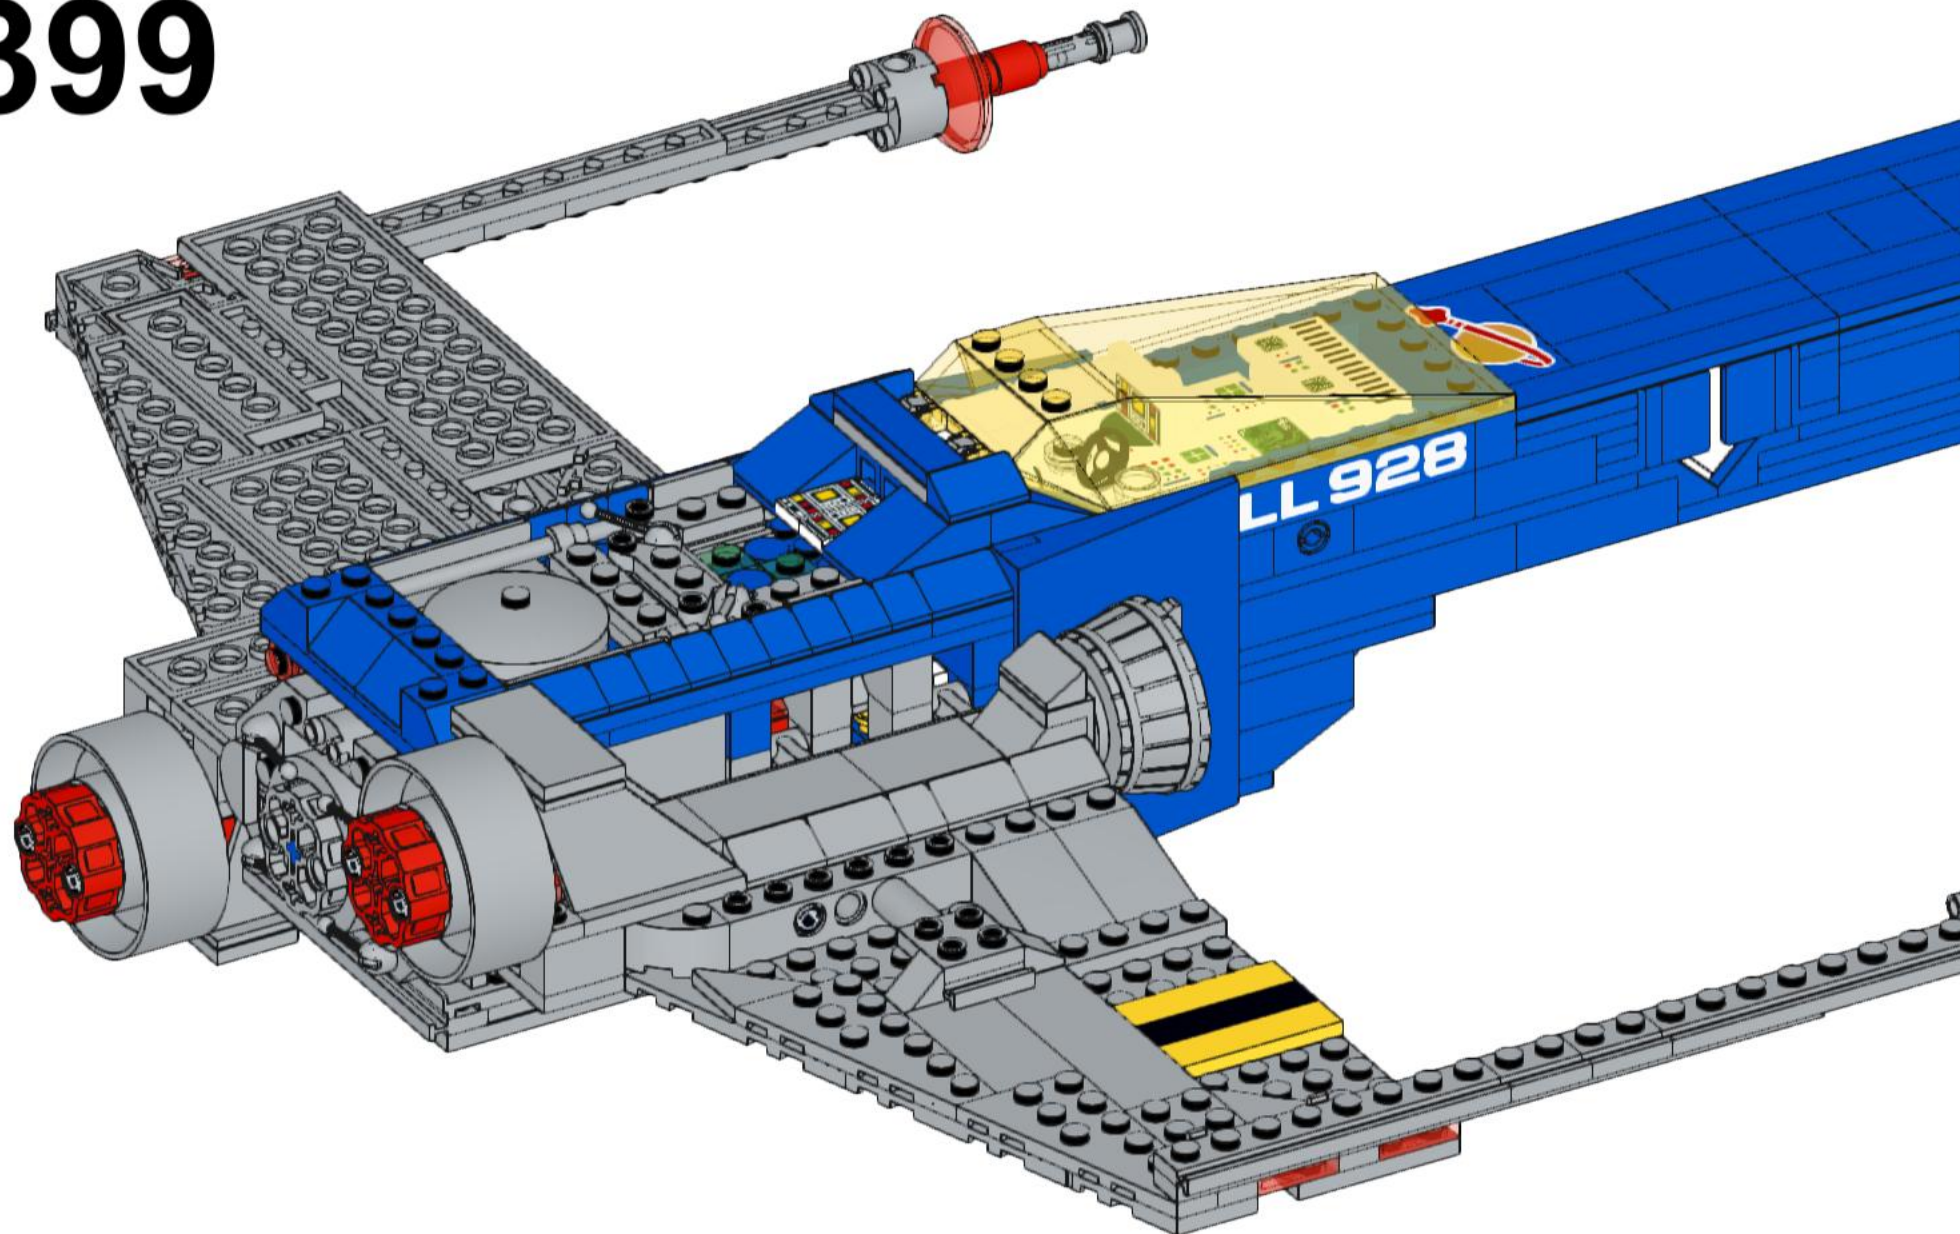

These two pieces need to be attached to *ONE* wing only, that being the *TOP* wing.

398

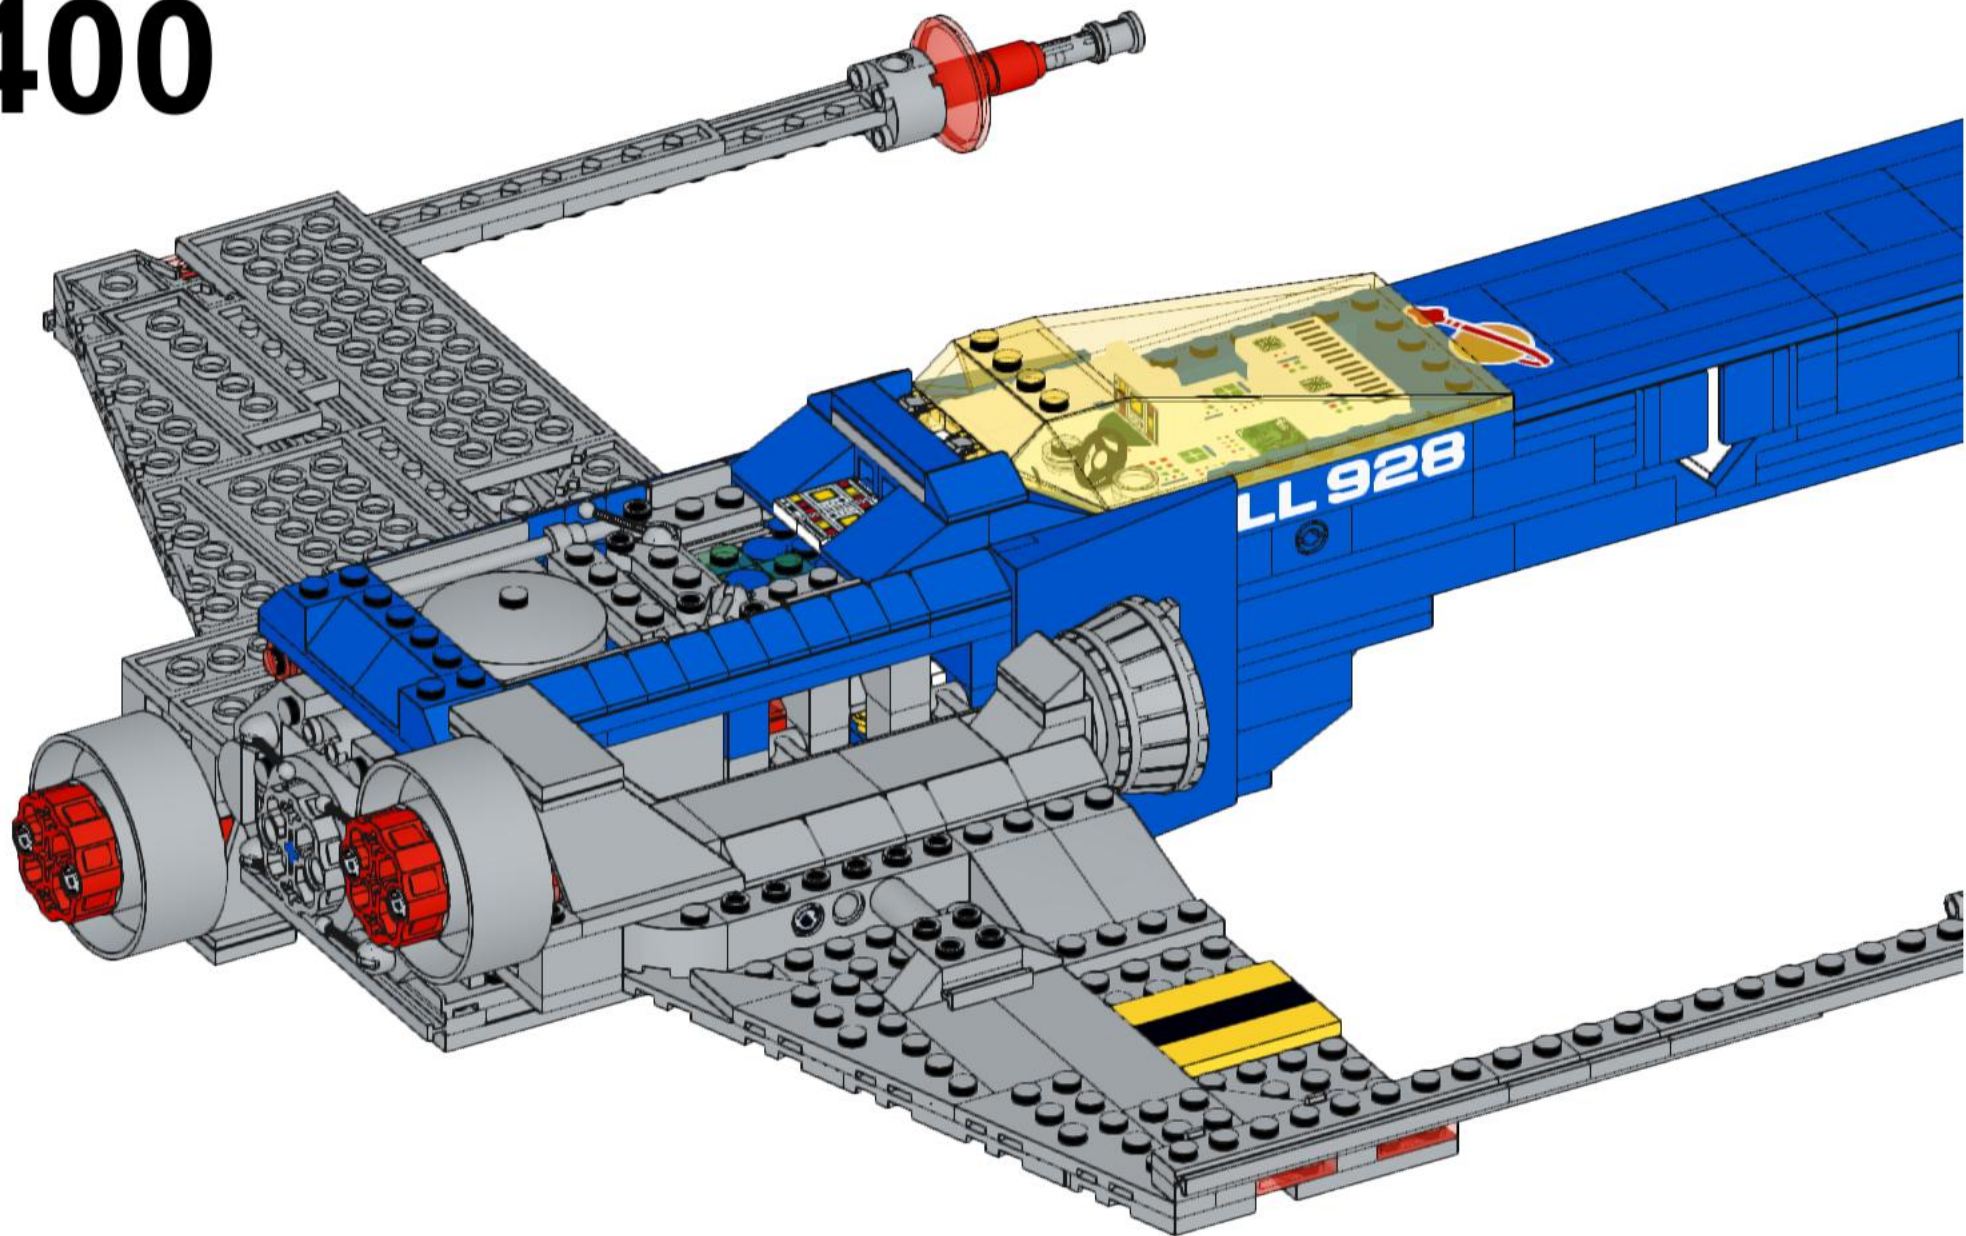

The extra two pieces will slide into this opening on the fuselage. They do not connect to the main build but instead provide stability to the wing.

OR

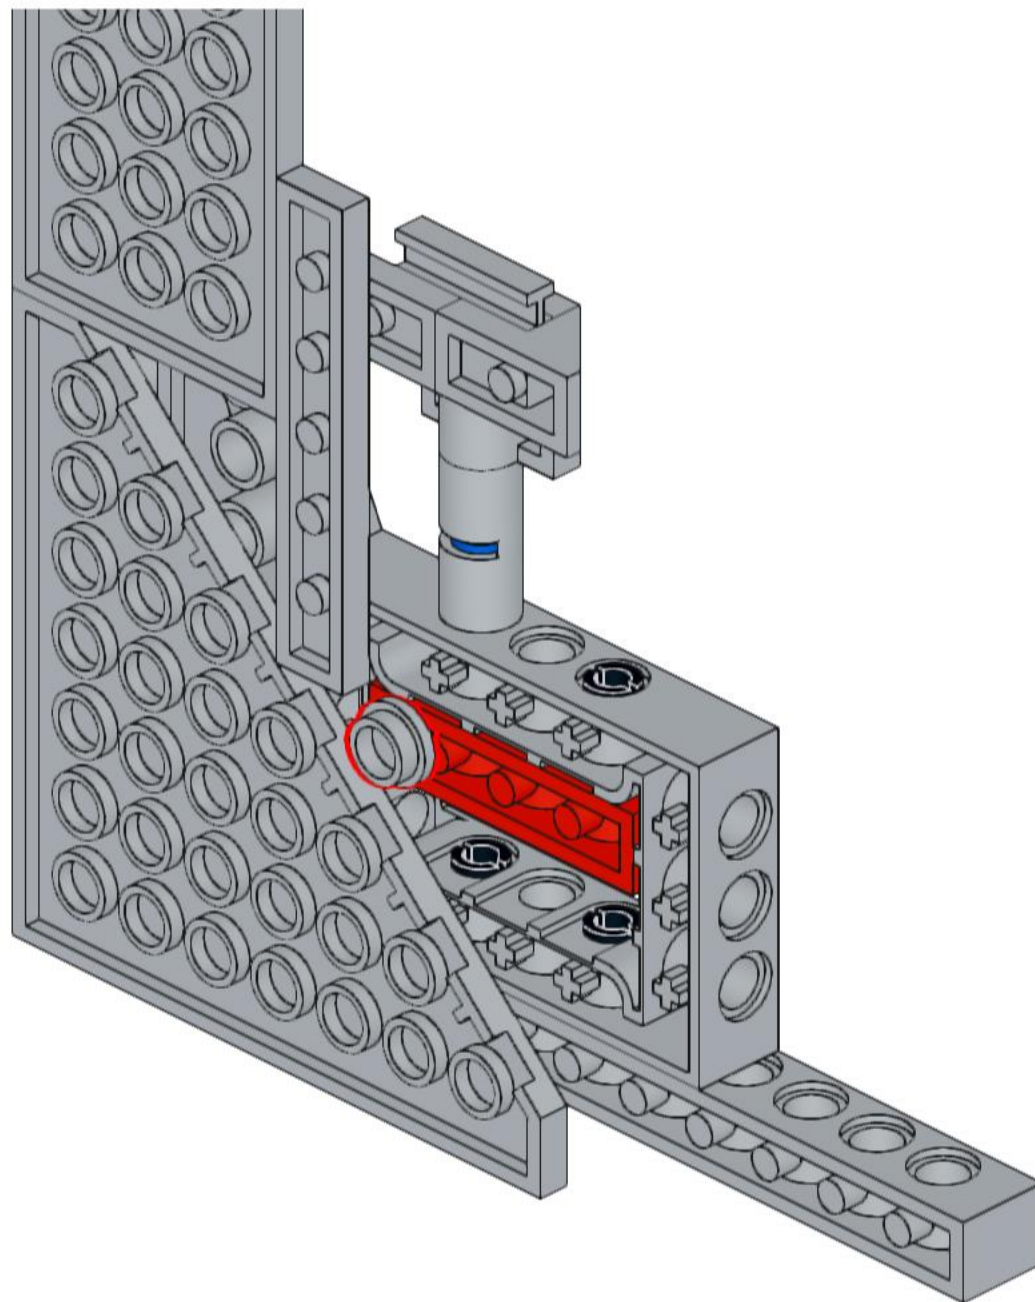

On this step your two wings will differ very slightly. One will use the single plate and the other will use the four smaller plates.

This is just due to the limited pieces in the Galaxy Explorer donor set. It is presented this way in the instructions so you can still build both of these wings at the same time.
